

CONCERNED ABOUT TICKS?

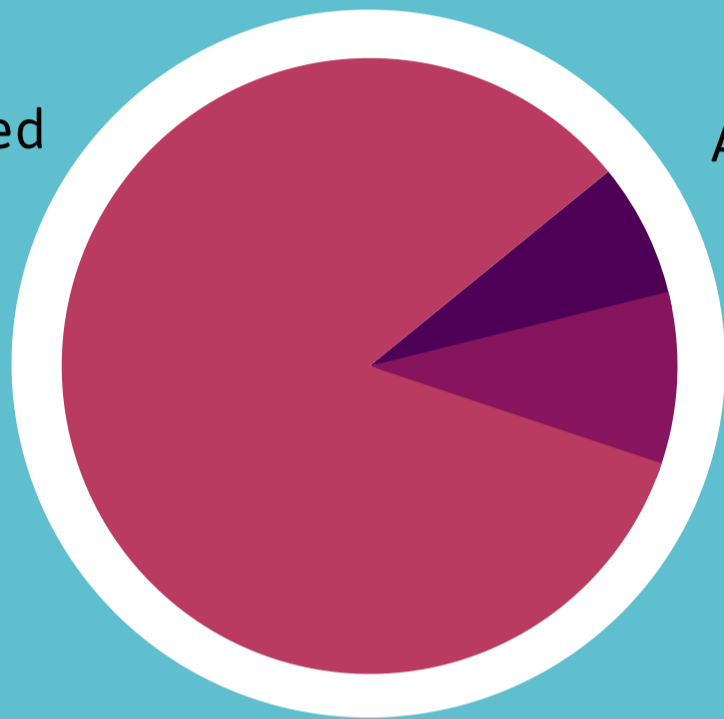

MUST KNOWS FOR PET OWNERS IN PRINCE EDWARD ISLAND

Ticks were submitted for 1 year (2019-2020) from 2 participating veterinary clinics in Prince Edward Island. These findings provide a snapshot of ticks in the region and highlight general patterns.

What tick species were submitted?

number of ticks = 44

Blacklegged ticks

American dog ticks

Other *Ixodes* species

Who was bitten?

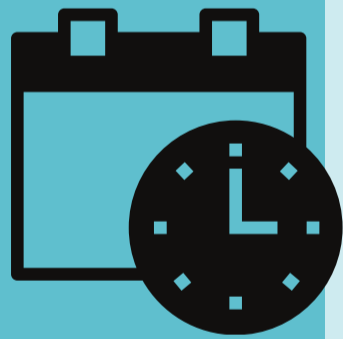

The majority of ticks were reported on dogs; however,

20% of ticks were seen on cats.

Make sure to keep both your canine and feline friends in mind when thinking about tick prevention!

When were ticks active?

85% of ticks were seen in the spring / early summer (May - July) and fall (October - November).

Tick risk can be present throughout the year if temperatures are above freezing.

Where did ticks bite?

1 in 2 ticks were found on the head, ears, and shoulders.

Pay special attention to these areas when doing your tick check!

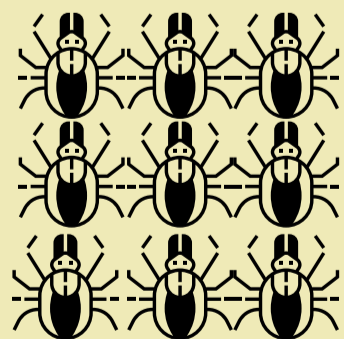

Why are we concerned?

12%

of blacklegged ticks were positive for *Borrelia burgdorferi*, the bacterium that causes Lyme disease. 15% were positive for the bacteria that causes anaplasmosis.

This is based on 33 pooled samples.

How do I protect my pet?

- ✓ Use a veterinarian-prescribed tick preventive
- ✓ Perform daily tick checks (don't forget to check yourself!)
- ✓ Speak with your veterinarian if you are travelling
- ✓ Avoid areas with higher risk of ticks, such as wooded areas and long grass
